September 4th: Checked the art site and bootstrap links.

September 5th: Made palettes, wireframes and decided on color scheme and overall layout.

September 6th: Made nav and footer base code. Troubles with changing the bootstrap given button color to the one on our palette.

September 7th: Added a responsive grid for use on the index page (landing page). The main problem related to its implementation, was based on the fact that we wanted to make different sized cells in each row, a cell would take 2 rows and 2 cols (Bootstrap units). At the end we decided on using nested grids.

September 8th: We researched about Bootstrap components that we could use in the page, in order to improve the view and accessibility of it.

September 9th: We had some troubles with aligning components so we took a look at the bootstrap documentation and learned some new classes that are marked as letters.

September 10th: Finished the nav and footer code with the correct colors and css modifications. While we were working on the sample code we ran into an issue regarding the use of variables in css. Which we later fixed and opted on using the variable for the palette in case we changed our minds on the specific color. Which we did and made it darker easily with the use of the variable

--logo. We made a template to use in all pages. Decided on who did which pages and scheduled a meeting the next day to check each other's progress.

September 11th: We worked on the pages we already agreed on. We finished the login, auction, gallery, profile and index pages. Including the navigation and CSS code. One problem we had was implementing the scripts for the auction page (Bidding and timer), which was solved after a few debugging sessions. We encountered a problem when we tried to implement two fonts on our pages. We decided on using class and element css instructions so we could easily change the text and labels and anchors that used a specific font. We added to a folder all the pictures used in the site (Paintings, user profile pictures, etc).

We also found out a page was not working correctly and after various efforts and changes we noticed that somehow we had a different bootstrap link on some pages.

We started deleting the templates we used for the artists and the auction pages.

September 12th: We finished linking the pages between each other. At the same time we finished updating the info on the cards to coincide with the info on the auctions page. We added more images and auction pages for the new images.

We finished hosting the webpage on Github and made some final tests on both PC and on mobile.
