Celia Lucía Castañeda Arizaga

When we started the project I worked on searching fonts and a color scheme so the page wouldn't be too overpowered colorwise, since we are building an art auction site which means that there are going to be lots of different colors due to lots of art pieces. So that's why I made different color palettes and we decided as a team which one to use.

I also made the wireframe of our main pages. It was a bit difficult imagining the page at first, but as I sketched I had new ideas and the pieces were starting to come together.

After we decided on the page's layout we made a sample page where we would build the header and footer since we were going to use those components on various pages. Eduardo wrote the sample code with me and Carlos helping out with ideas, improvements or questions that popped up.

When the sample code was finished we divided the pages. I did the login and the gallery page and we all contributed to the css file.

We all gave ideas and helped each other when we had doubts or problems.

After we had made our pages we gave each other feedback and then proceeded to join everything together with links and in the main we all contributed with images, text and auction pages for the images.

My peers worked really well, we all had ideas and supported each other. We were responsible with our assigned work and managed to agree on certain aspects not all of us were certain of.

I enjoyed working with this team and I also learned a lot about bootstrap, like keywords or letters that are included in classes and I understand the code's layout better. I also learned about modifying certain bootstrap functions in a css file apart from classes.
